Their pregnancies ended in tragedy.
Then Brigham and Women's disposed of the fetal remains against their wishes.

UNFATHOMABLE LOSS

By Jessica Bartlett
GLOBE STAFF

Editor's note: The following story contains descriptions of pregnancy loss and other trauma. If you or someone you know needs mental health support, the MassHelpLine offers resources at 833-773-2445.

The swelling throughout the tiny body was so severe, it was apparent even on the ultrasound, and the diagnosis was grim. At just 15 weeks gestation, Kelly's still-developing baby girl had a severe abnormality. If the child survived to birth, which was unlikely, the diagnosis was fatal.

Consults with medical teams showed there was little to be done, and at roughly 18 weeks into pregnancy, in January 2022, Kelly and her husband traveled from New Hampshire to a Boston-area clinic to end the pregnancy. Kelly spoke on the condition of anonymity, given the sensitive nature of her experience.

On forms, Kelly authorized the remains to be sent to Brigham and Women's Hospital for genetic testing and noted the family wanted to receive them afterward. A funeral home where her cousin worked faxed the hospital forms the day of the procedure to initiate the process, the family said in court documents.

It took six weeks for the couple to receive the pathology results, and when they went to retrieve their daughter's remains, a Brigham pathologist ultimately told them they had been "misplaced" and apparently

When Kelly (top) tried to recover her daughter's remains, they were gone. She had a butterfly tattoo made that incorporates the child's footprints.

Vaccine rates for kids edge downward

More kindergarten classes don't have herd immunity

By Jason Laughlin
GLOBE STAFF

At first glance, newly released data on immunization rates among children in Massachusetts seem to validate the efforts by state officials to lead a national resistance to Health Secretary Robert F. Kennedy's antivax ideology.

And indeed, overall vaccination rates this school year held firm, according to the Department of Public Health, itself an accomplishment at a time when the federal government is aggressively trying to reverse decades of time-tested immunization policy. Yet even here, home to the measles vaccine and the nation's first public health department, there are concerning hints of slippage.

A shock for nonsmokers: lung cancer

Rates for Asian American women are notably elevated

By Marin Wolf
GLOBE STAFF

Asian American women are increasingly developing lung cancer without ever smoking — and without access to screening that could detect the disease at an earlier stage.

While rates of the disease have been decreasing in every other group, a 2023 study found rates among nonsmoking Asian American women rose 2 percent annually between 2007 and 2018.

Because of strict federal guidelines that prioritize screening for longtime, heavy smokers, most health insurance providers won't pay for annual CAT scans that could detect the often-silent disease early in certain nonsmokers and people with shorter smoking histories. Those screening rules are narrow and could keep patients from receiving care until it's too late, say many Boston-area researchers and advocates working to raise awareness about the risk disparities.

For Berklee students, AI class is a showstopper

Using the technology as a teaching aid, they claim, would undermine the whole point of becoming an artist

By Aaron Pressman
GLOBE STAFF

How would you feel paying \$85,000 a year to one of the world's most prestigious arts colleges, only to be taught how to eliminate your career?

That's how some students at Berklee College of Music view the Boston school's growing efforts to educate them about using generative artificial intelligence.

Like many young people, they are concerned about AI's impact on the environment, use of copyrighted material for

training, and potential to eliminate jobs. Such concerns have sparked anti-AI tension at other schools, including Dartmouth and the University of Colorado.

But at Berklee, the future composers, songwriters, and musicians are also worried about how using AI may be in effect stealing from the works of all prior artists, interfering with their ability to develop their own voices, and destroying their career opportunities.

The latest contretemps started when the school promoted a
