2 dead, 6 wounded in shooting at downtown warehouse party

It is latest in string of unsanctioned gatherings in area to turn violent

By CHRISTOPHER BUCHANAN, HANNAH FRY AND LIBOR JANY

Two people were killed and six others were wounded at a warehouse party in downtown Los Angeles early Monday, the latest incident to turn violent

stemming from unsanctioned gatherings in the area, authorities said.

About 11 p.m. Sunday, a “big party” was shut down at a warehouse in the 1100 block of 14th Place after officers saw a person possibly armed with a gun inside, said Los Angeles Police Officer Norma Eisenman. That per-

son was arrested at the scene, she said.

But about two hours later, at 1 a.m. Monday, officers were summoned to the area again after reports of gunfire, Eisenman said. Police said someone opened fire outside the warehouse and responding officers found eight people shot.

A partygoer who did not want to be named out of fear of retaliation said it sounded like “a hundred shots” were fired outside the event, causing people to stampede out of the warehouse and scatter into the street.

Heat is causing students around the world to underperform, study finds

Higher temperatures correlate to lower scores in complex subjects

By Marcos Magaña

GENARO MOLINA Los Angeles Times

LOCKWOOD Elementary students in East Hollywood are sent back inside because of extreme heat.

As climate change drives temperatures higher, prolonged periods of heat exposure are doing more than just making classrooms uncomfortable.

According to a new systematic review published in PLOS Climate, extended exposure to heat significantly impairs students’ cognitive abilities, affecting their academic performance, especially in complex subjects such as mathematics.

The study analyzed previous research encompassing nearly 14.5 million students across 61 countries. The findings show clear evidence that heat exposure over time is correlated to lower scores in math and other complex cognitive tasks among elementary, middle and high school students.

Even on days when temperatures were between 80 and 90 degrees Fahrenheit, the data show that students can experience heat stress, followed by a drop in cognitive performance. The effects of heat exposure on learning are often not seen until much later, said Kon-

stantina Vasilakopoulou, a Royal Melbourne Institute of Technology professor who co-wrote the paper with Matthaios Santamouris of the University of New South Wales. “So many studies have found that temperatures of the year before a serious exam affect students more than temperatures during the exam year itself. We simply do not have enough time to recover,” Vasilakopoulou said.

According to the paper, students from lower-income families often have less access to air-conditioned classrooms and homes, making them more vulnerable to the harmful effects of heat. Racial disparities were also evident in the data, with Black and Latino students in the U.S. seeing up to three times greater cognitive losses due to heat compared with their white peers.

“There are larger numbers of Black and Hispanic people living in poorer areas where the conditions are worse, temperatures higher, and air conditioning and ventilation often lacking.” [See Heat, A14]

Robot brings Japanese tradition to table

By PIPER HEATH

A local startup is using artificial intelligence and robotics in an unlikely way: making sashimi and other fish dishes better tasting, longer lasting and more humane.

El Segundo-based Shinkei Systems wants to bring a traditional Japanese method of handling fish to fine dining in America, using technology to replace the labor-intensive process historically handled by practitioners on board ships. Investors have just bet millions that it will succeed.

The company’s AI-driven

robot — called Poseidon — has been designed to do a traditional form of fish handling called *ikejime* in Japanese. It is a method of killing fish that enthusiasts say enhances flavor, texture and shelf life.

Although fish processed in this way is found in some of the best restaurants in Japan, it hasn’t been promoted in the U.S. because it is generally too expensive. Automating the process will make it more readily available to Americans, said Saif Khawaja, the company’s chief executive.

“My end goal is that you’re walking into your lo- [See Robot, A11]

California races to counter Texas voting map plan

Newsom preps for a Nov. 4 ballot measure if the GOP-led state redraws its lines first.

By MICHAEL WILNER, LAURA J. NELSON, SEEMA MEHTA AND TARYN LUNA

WASHINGTON — A last-ditch effort by California Democrats to redraw the state’s congressional map for the 2026 election, countering a similar push by Texas Republicans, is now up against the clock.

Gov. Gavin Newsom said Monday that Democrats are moving forward with a plan to put a rare mid-decade redistricting plan before voters on Nov. 4. But state lawmakers will craft a “trigger,” he said, meaning California voters would vote on the measure only if Texas moved forward with its own plans to redraw congressional boundaries to potentially add five Republican seats.

“It’s cause and effect, triggered on the basis of what occurs or doesn’t occur in Texas,” Newsom said. “I hope they do the right thing, and if they do, then there’ll be no cause for us to have to move forward.”

Democratic lawmakers in Texas on Monday left the state to deprive Republicans of the quorum needed to pass the new maps. Republican lawmakers voted 85 to 6 to send state troopers to arrest them and bring them back to the Capitol, a move that is largely symbolic, because the lawmakers won’t face criminal or civil charges.

The outcome of the dueling efforts between Texas and California could determine which party controls the House of Representatives after the 2026 midterm elections, which Democrats see as the last bulwark to President Trump’s actions in his second term. Trump has pushed Republicans to add more GOP seats in Texas, hoping to stave off a midterm defeat. [See Redistricting, A8]

Decades-long resident fights fast removal by ICE

Attorneys for Arizona mother of three U.S. citizens say agency is flouting federal law.

By ANDREA CASTILLO

WASHINGTON — Federal immigration authorities are attempting to quickly deport an Arizona woman who has lived in the U.S. for nearly 30 years, in what her lawyers are calling the first test of a federal law holding that longtime immigrants cannot be removed until they’ve had a chance to plead their case before a judge.

Lawyers for Mirta Amarilis Co Tupul filed a lawsuit Saturday night in U.S. District Court in Arizona and are seeking an emergency stop to Co Tupul’s imminent

deportation to Guatemala while the case plays out in court.

“Only this administration would go this far,” said Co Tupul’s lead attorney, Chris Godshall-Bennet, “because at the core of it is an underlying complete disrespect for the rule of law.”

Godshall-Bennet said the government’s move against Co Tupul is just the latest of many illegal actions being attempted by the Trump administration in its effort to remove as many immigrants as possible. If Co Tupul’s deportation is allowed to proceed, her defenders said, it could have wide implications for millions of other immigrants who have lived in the U.S. for many years and are at risk of deportation.

How AI helped Nvidia unseat Intel as top chipmaker

By QUEENIE WONG

Earlier this year, Intel’s new chief executive, Lip-Bu Tan, made frank remarks about how the Silicon Valley chipmaker keeps coming up short.

“For quite a long time for Intel, we fell behind on innovation. As a result, we have been too slow to adapt and to meet your needs,” Tan told Intel’s customers and partners at a company event in late March. “You deserve better, and we need to improve, and we will.”

Intel, a Santa Clara-based tech behemoth that fueled the rise of personal computers, sits at a major crossroads in the company’s 57-year-old history as the competition to dominate artificial intelligence escalates. Known for making the “brains” that power computers, Intel used to be the most valuable U.S. chipmaker before Nvidia claimed the top spot. It’s also facing more competition from rivals such as Advanced Micro Devices and Samsung.

The AI frenzy has greatly benefited Nvidia, a company that created a specialized computer chip that’s proven

valuable not only for gaming but also for AI model training, data centers and robotics. While Nvidia’s worth ballooned to more than \$4 trillion, Intel has seen its market value drop to around \$87 billion.

“It’s going to be tough for them,” said Mario Morales, group vice president for enabling technologies and semiconductors at the International Data Corporation. “They missed a very big shift and they don’t yet have the products in AI to compete — and that market is growing fast.”

In the last five years, Intel’s stock price has plunged more than 58%. It posted a net loss of \$18.8 billion in 2024 and plans to slash roughly 25,000 workers this year.

Intel’s lengthy history has been filled with highs and lows, but a series of big missed opportunities, manufacturing delays and management missteps hampered the growth of a company long synonymous with Silicon Valley’s rise, analysts say. Tan, a 65-year-old tech leader who became Intel’s chief executive in March, is trying to steer the company [See Nvidia, A11]
