Debating a rule for renters to keep cool

City considers a maximum limit on temperature

Landlords have a legal responsibility to keep renters from freezing in the winter. Should they have the same obligation to keep them cool amid the kinds of extreme heat hitting Massachusetts now?

A few cities in hot weather climates have set maximum indoor temperature laws, and importantly New York City and the county of Los Angeles are implementing ones, too. Generally they require landlords to install air conditioners and other cooling devices that shield tenants from sweltering temperatures.

With temperatures topping 100 degrees on Thursday, Nicole Rocci would appreciate just such a rule right about now. The 26-year-old lives in a basement studio apartment in Arlington where her lease does not allow her to install an air conditioner, leaving her to fend off the heat with fans and a dehumidifier.

“I feel gross when I wake up,” she said.

The City of Boston, too, has put down a marker on the issue: In its climate strategy released this spring, the Wu administration said it plans to advocate for state-level policies that establish

Even for mom, AI can prove a tough sell

Siblings’ split reflects broader divide on tech

By Aaron Pressman

Jana Amin, who graduated from Harvard last year, calls herself a strong AI skeptic. After witnessing too many fellow students using the technology as a crutch, she rejected AI and helped found a cafe in Cambridge to encourage people to enjoy activities like music performances and plain old conversations, away from their digital devices.

Many of her peers are wary of AI, worried about the technology’s impact on thinking and writing skills, job prospects, and the environment.

But in Amin’s case, it feels almost ironic. That’s because her mother, Rana el Kaliouby, is a pioneering scientist in AI who is well known in technology circles. She runs a venture capital fund called Blue Tulip Ventures, investing in AI startups, and previously cofounded Affectiva, an MIT Media Lab spinout now owned by Swedish firm Smart Eye.

Amin’s younger brother, Adam Amin, has followed more in his mom’s footsteps to become an AI power user. The Milton

PRESIDENT GERALD FORD

‘We have suffered great internal turmoil and torment in recent years.

Nevertheless, in all of the explosive changes of this and past generations, the American people have demonstrated a rich reserve of reason and of hope.’

At bicentennial, Ford offered unity; Trump has another message

WASHINGTON — Fifty years ago, as the nation’s 200th birthday approached, President Gerald Ford’s chief speechwriter had an overarching goal for the upcoming high-profile bicentennial addresses.

“While they of necessity deal with political and economic principles and institutions,” Robert Hartmann wrote in a June 10, 1976, White House memorandum, “there should be no campaign code words or partisan insinuations whatsoever.” President Trump apparently

didn’t get the memo.

While Ford used a milestone anniversary to try to unify a fractured nation, Trump hasn’t tried to replicate that spirit of ’76.

He’s delivered highly political, campaign-style speeches tied to America’s 250th birthday, a theme that was expected to continue at Mount Rushmore on Friday and in his Independence Day address in Washington, D.C., on Saturday night. He’s billed the July Fourth extravaganza in the nation’s capital, scheduled to include the largest fireworks display ever, as “A Ral

Nest-kept secret

In an idyllic corner of the internet, hundreds gather to watch the humble comings and goings of bald eagles

VERMONT INSTITUTE OF NATURAL SCIENCE

Windsor, V-2, and Dewey were seen in their nest via the Vermont Institute of Natural Science live stream.

QUECHEE, Vt. —

The eaglet was getting hungry. Nested 100 feet up a white pine tree on the Ottauquechee River, its chirps grew louder and louder as it waited for its parents to deliver food.

The 6-week-old bald eagle was all alone. Sort of.

There were devoted fans from all over Vermont — and around the world, as well — watching a live stream of the nest, some noting the baby bird, nicknamed V-2, had never gone this long without a visit or a fish from its parents, Windsor and Dewey.

“He must be so bored,” one wrote on Facebook. Another suggested V-2 could really use some takeout. Still more emailed the Vermont Institute of Natural Science, which installed the camera near the nest, expressing alarm that the eaglet looked malnourished.

Early the next morning, as fog lifted over the pond below, Windsor, the mother, swooped in with one fish, and then another. Overcome with hunger, V-2 stepped on its breakfast and tore at it with its beak.

“It turns out, eagles know what they’re doing,” said Alden Smith, VINS’ executive director.

Since March, when the Quechee-based institute launched the live stream, it’s become a surprise hit, drawing hundreds of viewers at a time and raising the profile of the small nonprofit that hosts it.

What they see is surprisingly captivating: The nest sways hypnotically in the breeze as V-2 flaps its wings or naps. Every so often, there’s a moment of excitement, such as a delivery of fish or a hot-air balloon drifting by in the background. But for the most part, it’s simply a serene summer setting, with a placid pond below, a natural soundtrack of birdsongs and the majestic sight of the country’s official national bird.

“Mostly nothing happens in the life of an eagle on a nest,” Smith said.

He expected the experiment would educate viewers about avian wildlife, a key component of the institute’s mission, along with rehabilitating injured, sick, and orphaned birds. What surprised him was the number of eagle cam aficionados who have credited
