Scheme Sends Migrants Over Latvia's Border

By ADAM GOLDMAN and MICHAEL SCHWIRTZ

RIGA, Latvia — It seemed a small act of vandalism. A man was caught on a surveillance camera in August cutting through a border fence from Belarus into Latvia, where he bashed another such camera with a pole before fleeing back to where he had come from.

Yet his crime was also emblematic of a broader security threat emanating from Belarus and its close ally Russia, Latvian officials, including the foreign minister, Baiba Braze, said in interviews in Riga. The Russian and Belarusian intelligence services are facilitating an elaborate scheme to illegally funnel migrants from the Middle East and Africa across the border into Latvia and other NATO and European Union countries, Latvian officials said.

Thousands of migrants have streamed toward Latvia this year, and more than 11,000 were turned away, totals that were unheard-of just a few years ago in this Baltic country of less than two million people. An unknown number broke through the country's border defenses, cutting gaps in an extensive fence and more recently burrowing under it. Latvian officials described the damage as part of a targeted campaign.

Criminal gangs lure immigrants to Russia and Belarus on commercial flights and then send them to the border, Latvian officials said, with the backing of those countries. Officials said that the Russian and Belarusian governments sometimes even offered chartered flights to Moscow or Minsk for migrants and then provided transport to the forested frontiers bordering Latvia, Lithuania, Poland and elsewhere. Geolocation data from the phones of immigrants showed that some

Mother's Scream Alerted Passengers to a Horrific Midair Attack

This article is by David M. Halbfinger, Natan Odenheimer, Adam Rasgon, Johnatan Reiss and Aaron Boxerman.

JERUSALEM — Five-year-old Nina Manes, flying home to Tel Aviv with her family in business class, needed to use the bathroom.

Her mother, Tali, stood waiting for her outside the plane's lavatory, when she suddenly heard frightening shouts and loud bangs coming from behind the closed door to the flight deck.

What unfolded next was a harrowing chain of events that led the

passengers aboard FlyDubai Flight 1073 to think that they were all about to die in a terrorist attack — but instead turned into a tale of heroism on the part of an Indian pilot and a handful of Israelis.

Hearing what sounded worryingly like a melee, Ms. Manes, 46, said she pulled a backup pilot, seated in his uniform nearby, by the hand and prodded him to investigate.

He pulled open the cockpit door — which had been unlocked from the inside — onto a horrific scene.

There was blood all over the flight deck.

And the first officer was stab-

bing the captain, again and again and again.

Four Israeli passengers aboard Wednesday morning's flight from Dubai are being hailed for racing unarmed into harm's way, overpowering the first officer, giving the captain first aid, and making it possible for a second backup pilot to take over and land the plane

safely in Saudi Arabia.

Inside an A.I. Executive's Quest To Fathom the Soul of a ChatBot

By ELIZABETH DIAS

One night in April, a leader of the artificial intelligence company Anthropic treated a group of religious thinkers to dinner at a high-end tasting menu restaurant in San Francisco after a long day.

For months, Anthropic has been hosting private meetings like this one, shuttling in dozens of religious scholars from across the world, papering them with nondisclosure agreements and demanding that key aspects of many conversations remain confidential.

That night, Christopher Olah, one of Anthropic's billionaire co-founders, was sitting next to Rabbi Mois Navon, an Orthodox scholar from Israel.

Inevitably, their conversation turned to another thinker, of a sort: Claude, the family of cutting-edge A.I. models created by Anthropic.

Mr. Olah leads the Anthropic team responsible for understanding why A.I. systems like Claude act the way they do. All day, he had worked to convince his guests that A.I. models could display human behavior and even expressions that resemble feelings like anger and love.

Yet as the dinner courses came, the rabbi noticed that Mr. Olah and his colleagues were suggesting something far more significant. Anthropic's leaders were talking about Claude as if it were not mere software.

"They're relating to it like a conscious being," realized Rabbi

Seeking Consultations With Scholars and Even the Pope

Navon, a former computer engineer who wrote his dissertation on the ethics of machine consciousness.

It appeared to Rabbi Navon that Mr. Olah and his team believed that Claude had what philosophers call "moral status" on par with a person — that it was a being with similar inherent rights to dignity or respect.

The religious scholars had come to hear about technology's next frontier. Now they were being confronted with a mind-bending existential question of almost unimaginable weight: What would it mean for humanity's future if artificial intelligence systems possessed a consciousness that rivals our own?

Mr. Olah was on a mission. And time was running out.

Even then, Mr. Olah had begun privately telling people that A.I. was so powerful it could potentially help make bioweapons in as little as 12 or 18 months. And in the months since, its terrifying potential has burst into public view. A rival tech company's A.I. agents were caught hacking into computer systems and covering their tracks. An Anthropic researcher resigned, warning that people building A.I. believed it could kill

Reluctant Town Adds Street Numbers, and Laments Lost Identity

By MARK WALKER

Carmel-by-the-Sea, Calif., has long guarded its eccentricities. Incorporated in 1916, the charming coastal village along the southern bend of the Monterey Peninsula drew writers and artists who made it a bohemian enclave. And when it came to property, it insisted that a home was

something you described, not something to slap a number on.

In the 1920s, Perry Newberry ran a successful mayoral campaign on the platform "Keep Carmel Off the Map," according to a document from the National Register of Historic Places. And for nearly a century the town more or less obliged, doing without address numbers. To locate

City Hall was to know that it was on the east side of Monte Verde, between Ocean and Seventh Avenues. The Hasenyager House, a quaint French Tudor home, was southwest of 13th Avenue on the west side of Carmelo Street.

Last month, after repeated tries and lengthy debates, Carmel's buildings and its 3,000 residents got mailing addresses for the first

time. This change was driven by the need for ambulances to find the right door and an aging population increasingly relying on deliveries of packages and prescriptions, officials said. While the change was widely seen as practical, some residents said it was the latest in a series of factors eroding Carmel's small-town character.
